

EXPERIMENT 02

c-prog in Linux

1. Enter editing mode by using any editor like VI editor or nano. In this case I will be using vi editor.
2. Use the command vi “name of the file”.c to enter editing mode.
3. Press “I” to enter editing mode and then type the code.

The screenshot shows a terminal window with a dark background. At the top, there is a menu bar with 'Terminal', 'Shell', 'Edit', 'View', 'Window', and 'Help'. Below the menu bar, the terminal title is 'UW PICO 5.09' and the file name is 'File: area.c'. The main area of the terminal displays the following C code in a light blue font:

```
#include <stdio.h>
#define PI 3.14
int main() {
    float radius, area;
    printf("Enter your radius: ");
    scanf("%f", &radius);
    area = PI*radius*radius;
    printf("Area of Circle: %f", area);
    return 0;
}
```

At the bottom of the terminal, there is a status bar with several icons and text: 'Get Help', 'Exit', 'WriteOut', 'Justify', 'Read File', 'Where is', 'Prev Pg', 'Next Pg', 'Cut Text', 'UnCut Text', 'Cur Pos', and 'To Spell'.

4. From running this code we will get an answer for the area of the circle where Radius(R) is 5 and the formulae is $PI \times radius \times radius$.
6. Then we will exit the file by pressing esc to exit the editing mode and entering command mode then type “:wq”.
7. Then we will show the different compiling stages of this program with the answer.

```
adilshakil ~ -zsh — 120x31

In this area.i, area.o, area.s are different compiling stages us humans can only edit the area.i stage rest are in binary or other language for the system to understand and if we edit them incorrectly the whole process will be ruined.
